

True concurrency, state transition on reaction

A
B done
A done
values
no physical
sense (relativity)
but we assume a discrete
model of time

Fixed point
Model time
transitions

updat PLC style
constraints on side effects
we get then same
set of possible sides
effects as true constraints

w/ PLC style constraints, side effects are
deferred to the end of time logical time tick, &
the side effects all occur logically simultaneously
